1 About this document

1.1 Instruction manual: purpose and scope of application

The present manual describes the functions and configurable parameters/commands of *Baumer* industrial encoders.

This manual applies to the following product families:

- *EAM580RS MT*
- *EAM580RS ST*

1.2 Applicable documents

- Available for download at www.baumer.com:
 - Data sheet
 - Safety Manual
 - EU Declaration of Conformity
- Attached to product:
 - Original operating and mounting instructions
 - General information sheet (11042373)

1.3 Labels in this manual

| Identifier | Usage | Example |
|-----------------------|--|---|
| <i>Dialog element</i> | Indicates dialog elements. | Click the OK button. |
| <i>Unique name</i> | Indicates the names of products, files, etc. | <i>Internet Explorer</i> is not supported in any version. |
| Code | Indicates entries. | Enter the following IP address: 192.168.0.250 |

1.4 Warnings in this manual

Warnings draw attention to potential personal injury or material damage. The warnings in this manual indicate different hazard levels:

| Symbol | Warning term | Explanation |
|---|----------------|---|
|  | DANGER | Indicates an imminent potential danger with high risk of death or serious personal injury if not being avoided. |
| | WARNING | Indicates potential danger with medium risk of death or (serious) personal injury if not being avoided. |
| | CAUTION | Indicates a danger with low risk, which could lead to light or medium injury if not avoided. |
| | NOTE | Indicates a warning of material damage. |
|  | INFO | Indicates practical information and tips that enable optimal use of the devices. |

2 General functionality

Absolute encoder 58 mm diameter. Safety-related position, speed and acceleration information is transmitted via CANopen Safety interface/protocol (EN 50325-5). Moreover, CANopen data is transmitted via standard CANopen interface as non-safety-related data. The encoder is developed in accordance with the CiA standards:

- CiA DS301 (communication profile)
- CiA DSP305 (LSS profile)
- CiA DS406 (encoder device profile)

Do not exceed the service life of the integrated ball bearings since wear and fatigue may result in bearing failure. The encoder may only be operated within the specified service life (see Safety Manual).

Once the service life has been reached, the encoder must be replaced. Depending on the application, service life may be limited by the service life of the integrated ball bearings.

3 **Operating principle**

The sensor element delivers the measurement signals for the absolute motion of the magnetic rotor. Absolute encoders assign a unique value to each position. For doing so, a magnet rotates across a detecting chip (Hall sensor) and measures the change in the magnetic field (Hall effect).

In the event of power failure, the unique shaft position will be retained. This eliminates the need for any reference run relating to the start or home position after power supply has been restored.

4 Block diagram

III. 1: Operating principle, overview

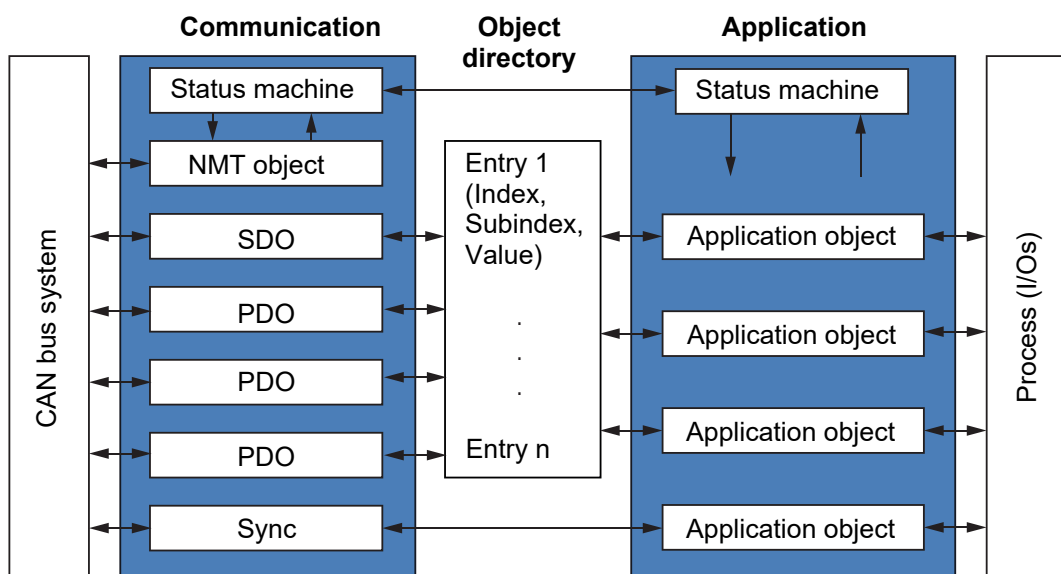

5 Interfaces

5.1 CANopen

CANopen is a common CAN application layer, optimized for fast data exchange in real-time systems. The organization CAN in Automation (CiA) is responsible for the standards applicable to the related profiles.

CANopen comprises the protocol definition (communication profile) as well as the device profiles for the respective device class. Process data objects (PDO) serve for fast communication of input and output data. The CANopen device parameters and process data are structured in an object directory.

Any data in this object directory are accessible via service data objects (SDO). There are more objects (e.g. telegram types) for network management (NMT), synchronization, error messages, etc.

III. 2: CANopen model

CANopen allows for:

- Easy access to all device and communication parameters
- Synchronization of several devices
- Automatic network configuration
- cyclic and event-driven process data traffic

CANopen consists of four communication objects (COB) with different properties:

- Process data objects for real-time data (PDO)
- Service data objects for parameter and program transfer (SDO)
- Network management (NMT, Heartbeat)
- Predefined objects (for synchronization, emergency messaging)

All device and communication parameters are organized in an object directory. An object includes object name, data type, number of sub indexes, structure of parameters and address. According to CiA, this object directory comprises three parts: Communication profile, device profile and manufacturer-specific profile.

5.1.1 Supported profiles

The following CANopen profiles are supported:

- CiA 301 / Version 4.2.0 (Communication)
- CiA 305 / Version 3.0.0 (LSS)
- CiA 406 / Version 4.1.0 (encoder profile)
- EN 50325-5 CANopen Safety protocol (formerly CiA 304)

5.1.2 Supported CANopen services

The device supports the following CANopen services:

- 1 Network Management (according to CiA 301)
- 1 SDO server (according to CiA 301)
- 2 TPDOs (according to CiA 301/CiA 406)
- 1 Emergency Producer (according to CiA 301/CiA 406)
- 1 Heartbeat Producer (according to CiA 301)
- 1 Node guarding (according to CiA 301)
- 1 LSS client (according to CiA 305)
- 3 SRDOs (in accordance with CiA 304/CiA 319/CiA 406)

5.1.3 SDO Service

The sensor supports 1 SDO server (expedited read/write, segmented read).

Structure of a SDO telegram:

| COB ID | DLC | Com- mand | Object L | Object H | Subindex | Data 0 | Data 1 | Data 2 | Data 3 |
|--------|-----|--------------|----------|----------|----------|--------|--------|--------|--------|
|--------|-----|--------------|----------|----------|----------|--------|--------|--------|--------|

A SDO-COB ID is structured as follows:

- Master → Encoder : 600h + *Node-ID*
- Encoder ← Master : 580h + *Node-ID*

DLC (Data length code) denotes the telegram length. It is structured as follows:

1 byte command + 2 byte object + 1 byte subindex + number of data bytes (0...4).

The command byte defines whether data is read or set and the number of data bytes:

| SDO command | Function | Length | Description |
|-------------|-------------------|--------------|---|
| 22h | Download Request | Max. 4 bytes | Send parameters to rotary encoder |
| 23h | Download Request | 4 bytes | |
| 2Bh | Download Request | 2 bytes | |
| 2Fh | Download Request | 1 bytes | |
| 60h | Download Response | – | Transfer confirmation to Master |
| 40h | Upload Request | – | Parameter request to encoder |
| 42h | Upload Request | Max. 4 bytes | Parameters to master with max. 4 bytes |
| 43h | Upload Request | 4 bytes | |
| 4Bh | Upload Request | 2 bytes | |
| 4Fh | Upload Request | 1 bytes | |
| 80h | Abort Message | | Rotary encoder reports error code to master |

abort message signals an object access error. SDO command byte is 80h. Object and subindex are those of the requested object. The error code comes in bytes 8...5.

| COB ID | DLC | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 | Byte 8 |
|-------------------|-----|--------|----------|----------|----------|-----------|-----------|-----------|-----------|
| 580h + Node-ID | 8 | 80h | Object L | Object H | Subindex | ErrByte 0 | ErrByte 1 | ErrByte 2 | ErrByte 3 |

Bytes 8...5 equal SDO *abort message* (byte 8 = MSB). The following messages are supported:

- 05030000h - Toggle bit unchanged
- 05040001h - Command not valid or unknown
- 06010001h - Read access to write only
- 06010002h - Write access to read only
- 06020000h - Object supported
- 06040041h - No object mapping to PDO
- 06040042h - would exceed PDO length

- 06040042h - Parameter incompatible
- 06060000h - Access error due to hardware error
- 06070010h - Incorrect data type
- 06090011h - Subindex not supported
- 06090030h - Value outside the limit
- 06090031h - Value too high
- 06090032h - Value too small
- 08000000h - General error
- 08000020h - Incorrect memory signature
- 08000022h - Error due to current device status
- 08000024h - No data available

SDO examples

Master requests value from slave. Typical query is a position query: Object 6004h

| COB ID | DLC | Com- mand | Object L | Object H | Subindex | Data 0 | Data 1 | Data 2 | Data 3 |
|-------------------|-----|--------------|----------|----------|----------|--------|--------|--------|--------|
| 600h + Node-ID | 8 | 40h | 04h | 60h | 0 | x | x | x | x |

Slave responds position value to master. The position value has a length of 4 bytes, detailed values can be found at object 6004h.

| COB ID | DLC | Com- mand | Object L | Object H | Subindex | Data 0 | Data 1 | Data 2 | Data 3 |
|-------------------|-----|--------------|----------|----------|----------|--------|--------|--------|--------|
| 580h + Node-ID | 8 | 43h | 04h | 60h | 0 | a | b | c | d |

Master writes value to slave. Setting the position value is in preset object 6003h.

| COB ID | DLC | Com- mand | Object L | Object H | Subindex | Data 0 | Data 1 | Data 2 | Data 3 |
|-------------------|-----|--------------|----------|----------|----------|--------|--------|--------|--------|
| 600h + Node-ID | 8 | 22h | 03h | 60h | 0 | a | b | c | d |

Response of slave to written value.

| COB ID | DLC | Com- mand | Object L | Object H | Subindex | Data 0 | Data 1 | Data 2 | Data 3 |
|-------------------|-----|--------------|----------|----------|----------|--------|--------|--------|--------|
| 580h + Node-ID | 8 | 60h | 03h | 60h | 0 | a | b | c | d |

5.1.3.1 Store parameters

Writing the ASCII value **save** to 1010h-x will save the corresponding to the non-volatile memory. The parameters are loaded from the non-volatile memory after reset or power-on.

The SDO request to 1010h-x is answered after the parameters have been saved.

WARNING

Unexpected device behavior caused by incorrect settings

Interruption of power supply immediately after transmission of the save command will restore the default parameters at next power-on.

- a) Make sure power supply is not interrupted immediately after transmission of the save command.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1010h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|-----------------------------|
| Store parameters | 1010h | – | |
| Highest subindex supported | | 00h | 5 |
| Save all parameters | | 01h | =“evas“ (65766173h) to save |
| Communication parameters | | 02h | =“evas“ (65766173h) to save |
| Application parameters | | 03h | =“evas“ (65766173h) to save |
| Manuf. specific parameters | | 04h | =“evas“ (65766173h) to save |
| Manufacturer LSS Group | | 05h | =“evas“ (65766173h) to save |

| Signature | MSB | | | | LSB | |
|-----------|-------------------|-------------|-------------|-------------|-----------|--|
| ISO 8859 | e | v | a | s | character | |
| | 0x65 | 0x76 | 0x61 | 0x73 | hex | |
| | 1702257011 | | | | dez | |

5.1.3.2 Restore default parameters

Writing the ASCII value **load** to 1011h-x will immediately restore default in the corresponding objects.

NOTICE

Changes will not be adopted until reset or at next power-on.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1011h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|-----------------------------|
| Restore default parameters | 1011h | – | |
| Highest subindex supported | | 00h | 5 |
| All parameters | | 01h | =“daol” (64616F6Ch) to load |
| Communication parameters | | 02h | =“daol” (64616F6Ch) to load |
| Application parameters | | 03h | =“daol” (64616F6Ch) to load |
| Manuf. specific parameters | | 04h | =“daol” (64616F6Ch) to load |
| Manufacturer LSS Group | | 05h | =“daol” (64616F6Ch) to load |

| Signature | MSB | | | LSB | |
|-----------|-------------------|-------------|-------------|-------------|-----------|
| ISO 8859 | d | a | o | l | character |
| | 0x64 | 0x61 | 0x6F | 0x6C | hex |
| | 1684107116 | | | | dez |

5.1.4 PDO Service

TPDO1 and TPDO2 are supported. PDO transmission is only in NMT operating mode **Operational**.

5.1.4.1 Communication types

CANopen supports different communication types of process data objects. The following communication types are supported (object 180xh-2):

| Communication type | Description |
|--|---|
| Synchronous transmission (1-240) | In synchronous data transmission, PDO transmission is after the n-th sync frame. |
| Asynchronous transmission (255) | In asynchronous data transmission, PDO transmission is time-triggered. The time interval between 2 PDOs can be set in object 180xh-5 or alternatively in 6200h. |
| Manufacturer-specific transmission (254) | Standard setting. Corresponds to asynchronous transmission. |

For detailed parameter information see chapter [Annex \[▶ 63\]](#).

5.1.4.2 COB-ID

The COB ID for both PDOs is changed by object 180xh-1.

Standard values:

- TPDO1: 180h + *Node-ID*
- TPDO2: 280h + *Node-ID*

Changes are immediately adopted.

NOTICE

Overwriting and saving the COB ID for TPDOx will retain it even in the event of later changes to the *Node-ID*.

5.1.4.3 PDO mapping

The encoder supports dynamic mapping. Both objects 1A00h and 1A01 are used for configuration.

The standard configuration is defined in the object directory.

Instruction:

- a) Disable mapping by writing 0 to object 1A0xh-0.
- b) Write the desired mapping entry.
- c) Re-enable mapping by writing the number of the PDO content to object 1A0xh-0.

INFO

In the object directory, in column *Access rights* the mappable objects are flagged with *m*.

5.1.4.3.1 TPDO mapping parameter

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1A00h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|--------------------|
| Transmit PDO1 mapping | 1A00h | – | |
| Highest subindex supported | | 00h | Maximum value is 8 |
| 1st mapping parameter | | 01h | Position encoder |

CANopen access: 1A01h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|--------------------|
| Transmit PDO2 mapping | 1A01h | – | |
| Highest subindex supported | | 00h | Maximum value is 8 |
| 1st mapping parameter | | 01h | Position encoder |

5.1.4.3.2 TPDO communication parameter

For more detailed information on the following please refer to chapter [Annex ▸ 63](#).

CANopen access: 1800h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|--------------------|
| Transmit PDO1 mapping | 1800h | – | |
| Highest subindex supported | | 00h | |
| COB-ID | | 01h | COB-ID for TPDO 1 |
| PDO type | | 02h | Transmission type |
| Event timer | | 05h | Cycle time [in ms] |

CANopen access: 1801h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|--------------------|
| Transmit PDO2 mapping | 1801h | – | |
| Highest subindex supported | | 00h | |
| COB-ID | | 01h | COB-ID for TPDO 2 |
| PDO type | | 02h | Transmission type |
| Event timer | | 05h | Cycle time [in ms] |

5.1.4.3.3 Cycle timer PDO1

This object mirrors object 1800:05h (*Event timer*).

For more detailed information on the following please refer to chapter [Annex ▸ 63](#).

CANopen access: 6200h

| Name | Object | Subindex | Description |
|------------------|--------|----------|---|
| Cycle timer PDO1 | 6200h | – | In milliseconds, internally linked to object 1800:05h |

5.1.5 Network management (NMT)

Network management (NMT) defines the communication behavior of a *CANopen* node.

There are two categories of network management: The NMT services for device control can be used to initialize, start and stop the bus devices. There are also NMT services for connection monitoring.

There are the following status:

- *Init (Initialisation)*
- *Pre-Operational*
- *Operational*
- *Stopped*

III. 3: Status of a *CANopen* node

| | |
|------------------|---|
| (1) | At Power On the NMT state initialisation is entered autonomously |
| (2) | NMT state initialisation finished - enter NMT state Pre-Operational automatically |
| (3) | NMT service start remote node indication or by local control |
| (4), (7) | NMT service enter Pre-Operational indication |
| (5), (8) | NMT service stop remote node indication |
| (6) | NMT service start remote node indication |
| (9), (10), (11) | NMT service reset node indication |
| (12), (13), (14) | NMT service reset communication indication |

| Status | Description |
|------------------------------|--|
| <i>Init (Initialisation)</i> | After power on, a <i>CANopen</i> node is automatically in status <i>Init</i> . Having completed <i>Init</i> , the node is automatically in status <i>Pre-Operational</i> . |

| Status | Description |
|------------------------|--|
| <i>Pre-Operational</i> | The service data objects (SDO) are active and the node can be configured. The process data objects (PDO/SRDO) are still blocked. Reading/writing SDO parameters is only enabled in NMT status . <i>Pre-Operational</i> |
| <i>Operational</i> | The process data objects (PDO/SRDO) are active. If reading or communication is no longer feasible due to a problem (e.g. CAN error), the encoder will try to transmit a corresponding emergency message. This way, the <i>CANopen</i> master will immediately recognize any fatal error. |
| <i>Stopped</i> | Communication with node is not possible. Only NMT messages are received. The outputs go into error state. |

5.1.5.1 NMT Reset Communication

This function will trigger CAN controller restart.

Internal initialization time is <1s. Next, the boot-up message is transmitted.

NOTICE

Any configuration parameters which had not been saved will be lost.

CANopen: NMT Reset Communication

| COB-ID | Byte 0 | Byte 1 |
|--------|----------------------------------|--------------------------|
| 0 | 82h (NMT Communication Reset) | Node-ID (0=Broadcast) |

Tab. 1: NMT-Frame

Once having successfully completed the function, the encoder transmits a *Boot-up Message*.

| COB-ID | Byte 0 |
|----------------|--------|
| 700h + Node-ID | 00 |

5.1.5.2 NMT Reset Node

Command *NMT Reset Node* will completely reset the encoder.

Internal initialization time is <1s. Next, the boot-up message is transmitted.

NOTICE

Any configuration parameters which had not been saved will be lost.

CANopen: NMT Reset Node

| COB-ID | Byte 0 | Byte 1 |
|--------|--------------------|--------------------------|
| 0 | 81h (NMT Reset) | Node-ID (0=Broadcast) |

Tab. 2: NMT-Frame

Once having successfully completed the function, the encoder transmits a *Boot-up Message*.

| COB-ID | Byte 0 |
|----------------|--------|
| 700h + Node-ID | 00 |

5.1.6 Heartbeat

The sensor supports heartbeat producer functionality. Configuration is in done via object 1017h.

A *Heartbeat Producer* is cyclically transmitting the heartbeat message at the frequency specified in object *Producer heartbeat time*. One or more *Heartbeat Consumer* can receive the message. The relationship between producer and consumer is configured via object directory entries. The *Heartbeat Consumer* monitors heartbeat reception within the *Heartbeat Consumer Time*. Not receiving the heartbeat within this time will generate a heartbeat event.

Example of a heartbeat protocol

| COB-ID | Data/Remote | Byte 0 |
|--------|-------------|------------|
| 701h | d | 7Fh (127d) |

Heartbeat messages comprise the *COB-ID* and one byte. The NMT status is delivered in the byte.

- 0: Boot up event
- 4: Stopped
- 5: Operational
- 127: Pre-Operational

In other words, in the example, the sensor is in state Pre-Operational (7Fh = 127).

5.1.6.1 Producer heartbeat time

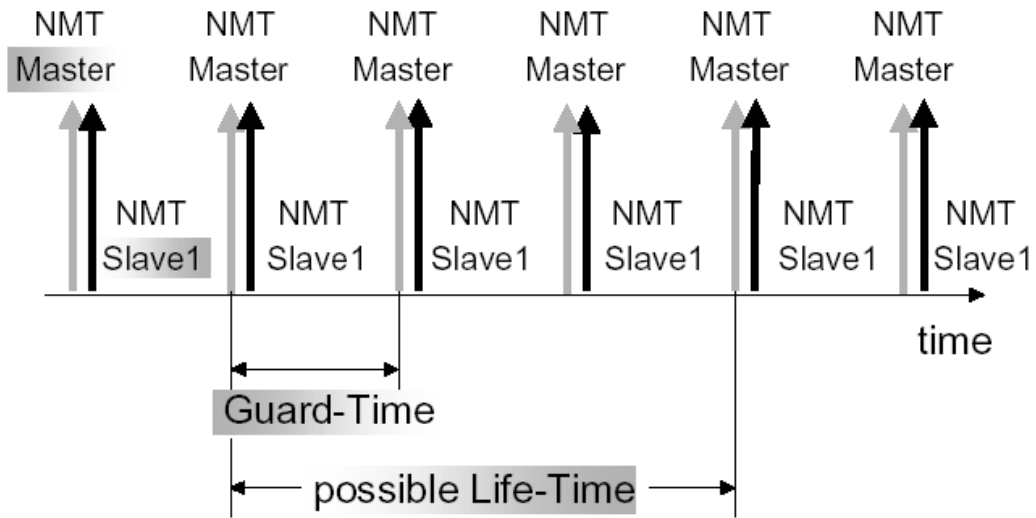

Function *Producer heartbeat time* is used to read/write the producer heartbeat time in [ms].
 For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1017h

| Name | Object | Subindex | Description |
|-------------------------|--------|----------|---|
| Producer heartbeat time | 1017h | – | Producer heartbeat time [ms]. 0=deaktiviert |

5.1.7 Node and life guarding

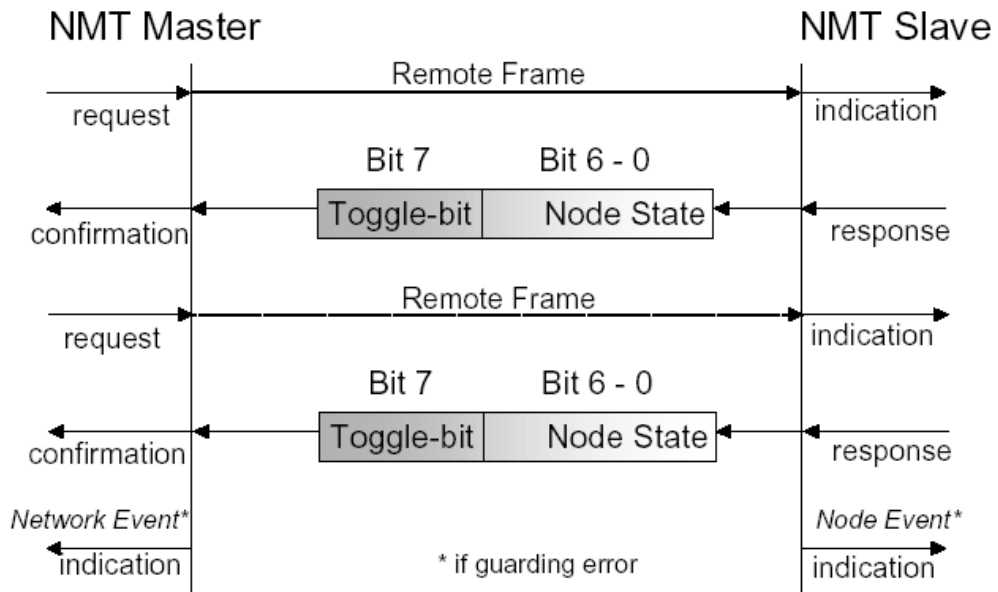

The sensor supports the node and life guarding functionality. Configuration is via CANopen objects 100Ch and 100Dh.

The NMT master can create a database with the respective NMT status of each node. This log can be used to check whether a node has withdrawn from the bus connection. Furthermore, each node can also monitor whether the control unit is still active.

The NMT master starts monitoring by a remote frame to the desired node. Each remote frame resets the life time at the station. In addition, the station returns its NMT status. This allows the NMT master to check whether the node is in correct NMT state and to react in the event of error.

Lifetime having expired will trigger a "node event". The behavior in the event of error is defined in object 1029h-1h.

5.1.7.1 Guard time

This function is for reading/writing of Guard time. Guard time defines the sensor monitoring interval (node guarding). 0 means no monitoring.

Multiplying the values of Guard time and Life Time equals the watchdog length for mutual monitoring (Life Guarding/Node Guarding).

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 100Ch

| Name | Object | Subindex | Description |
|------------|--------|----------|---|
| Guard time | 100Ch | – | Guard time (actual guard time is Object 100Ch*100Dh [ms]) |

[Life time factor \[▶ 23\]](#)

5.1.7.2 Life time factor

This function is for reading/writing the Life time factor.

Multiplying the values of Guard time and Life time equals the watchdog length for mutual monitoring (life guarding/node guarding).

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 100D

| Name | Object | Subindex | Description |
|------------------|--------|----------|-------------|
| Life time factor | 100D | – | |

5.1.8 Layer Setting Service (LSS)

Baud rate and *Node-ID* can be configured via LSS (compliant to CiA 305). Alternatively, baud rate and *Node-ID* can be changed by accessing objects 2100h and 2101h.

INFO

The values required for LSS addressing, such as *Vendor ID*, revision number, product code and serial number, are printed on the label provided at the encoder housing.

5.1.8.1 Supported functions

- Switch state global
- Switch state selective
- Enable bit timing parameter
- Configure bit timing parameters
- *Node-ID*-Configure protocol
- Save configuration
- Polling the LSS address
 - Polling the Identity *vendor ID*
 - Polling the product code identity
 - Polling the identity revision number
 - Polling the identity serial number
- Polling the *Node-ID*
- Identify LSS slave
- LSS Fastscan

5.1.8.2 Message structure

COB-ID

Consumer → Producer : 2021 = 7E5h

Consumer ← Producer : 2020 = 7E4h

The COB-ID is followed by a LSS comand specifier (cs) . In the next step, up to seven data bytes will be transmitted.

| COB-ID | cs | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
|--------|----|--------|--------|--------|--------|--------|--------|--------|
|--------|----|--------|--------|--------|--------|--------|--------|--------|

Switch state global

| | | | |
|--------|-----|-------|----------|
| 7E5h → | 04h | State | Reserved |
|--------|-----|-------|----------|

State:
 0: Operational state
 1: Configuration state

Switch state selective

| | | | |
|--------|-----|-----------------|----------------------|
| 7E5h → | 40h | Vendor ID | Reserved |
| 7E5h → | 41h | Product code | Reserved |
| 7E5h → | 42h | Revision number | Reserved Reserved |
| 7E5h → | 43h | Serial number | Reserved |
| 7E4h ← | 44h | Status | Reserved |

Vendor ID: 5Fh
 Product code: Internal product code for the respective sensor
 Revision number: Current sensor revision number
 Serial number: Unique, consecutive serial number
 Status: The sensor returns the new status (0=operating status; 1=configuration status)

5.1.9 Baudrate

This function sets the encoder to a specific baud rate.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 2100h

| Name | Object | Subindex | Description |
|----------|--------|----------|---|
| Baudrate | 2100h | – | <ul style="list-style-type: none"> ▪ 0: 10 kBit/s (not supported) ▪ 1: 20 kBit/s (not supported) ▪ 2: 50 kBit/s ▪ 3: 100 kBit/s ▪ 4: 125 kBit/s ▪ 5: 250 kBit/s ▪ 6: 500 kBit/s ▪ 7: 800 kBit/s ▪ 8: 1000 kBit/s |

NOTICE

Table is different from the CiA standard bit timing LSS table.

- Save the new baud to the non-volatile memory using object 1010h.
- The new baud rate will become effective after device restart or NMT Reset.
- Alternatively LSS can be used for baud rate / bit timing configuration.

5.1.10 Node-ID

This function is for reading and writing the *Node-ID*.

CANopen access: 2101h

The new *Node-ID* becomes effective after NMT Reset or power on (provided the parameters were saved to the non-volatile memory).

| Name | Object | Subindex | Description |
|---------|--------|----------|--------------------------|
| Node-ID | 2101h | – | Node-ID 1...127 possible |

5.1.11 SRDO COB-ID configuration

The COB ID for each of the 3 SRDOs will be automatically assigned and according to the formulas and tables below:

NOTICE

- a) Node IDs configured within the range 1 ... 22 will be automatically assigned the COB IDs for SRDOs without the risk of collisions.
- b) Node IDs configured within the range 23 ... 127 may cause colliding SRDO COB-IDs and require manual intervention (see the following tables)

| | COB-ID 1 normal | COB-ID 2 inverted |
|---------------|---|---|
| SRDO 1 | $FFh + (2 * \text{Node-ID})$; If result > 17Fh then 17Fh is automatically assigned as default value | $FFh + 1 + (2 * \text{Node-ID})$; If result > 180h then 180h is automatically assigned as default value |
| SRDO 2 | $129h + (2 * \text{Node-ID})$; If result > 17Fh then 17Fh is automatically assigned as default value | $129h + 1 + (2 * \text{Node-ID})$; If result > 180h then 180h is automatically assigned as default value |
| SRDO 3 | $153h + (2 * \text{Node-ID})$; If result > 17Fh then 17Fh is automatically assigned as default value | $153h + 1 + (2 * \text{Node-ID})$; If result > 180h then 180h is automatically assigned as default value |

Tab. 3: SRDO COB-ID calculation

| Node-ID | SRD01 COB-ID | | SRD02 COB-ID | | SRD03 COB-ID | | Node-ID | SRD01 COB-ID | | SRD02 COB-ID | | SRD03 COB-ID | | | | | | | | | | | | | |
|---------|--------------|---------|--------------|---------|--------------|---------|---------|--------------|---------|--------------|---------|--------------|---------|-----|------|-----|------|-----|------|-----|------|-----|------|-----|------|
| | normal | invert. | normal | invert. | normal | invert. | | normal | invert. | normal | invert. | normal | invert. | | | | | | | | | | | | |
| | dez hex | dez hex | dez hex | dez hex | dez hex | dez hex | | dez hex | dez hex | dez hex | dez hex | dez hex | dez hex | | | | | | | | | | | | |

5.1.12 Identification

5.1.12.1 Baumer Device Information

This function is for readout manufacturer-specific device information.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 2800h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|--|
| Baumer Device Information | 2800h | | |
| Highest subindex supported | | 00h | |
| Serial Number | | 01h | String version of 1018h-04h, resp. 650Bh |
| Article Number | | 02h | SAP number of the encoder |
| Order Number | | 03h | Baumer order number |
| Product key | | 04h | EAM580RS_MT / EAM580RS_ST |
| Product name | | 05h | e.g. EAM580RS-SCB.EJCS.14180.J |
| Manufacturer date | | 06h | Date in format "DD.MM.YYYY hh:mm:ss" |

5.1.12.2 Device Name

This function is for readout the sensor's device name (manufacturer's device name).

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1008h

| Name | Object | Subindex | Description |
|------------|--------|----------|--|
| DeviceName | 1008h | – | DeviceName: EAM580RS_MT bzw. EAM580RS_ST |

5.1.12.3 Device Type

Function *Device type* is for readout the device type.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1000h

| Name | Object | Subindex | Description |
|-------------|--------|----------|---|
| Device Type | 1000h | – | <ul style="list-style-type: none"> ■ 00010196h: Singleturn encoder ■ 00020196h: Multiturn encoder |

5.1.12.4 Identity object

Function *Identify Object* is for readout of product information. This includes

- *Vendor ID*
- Product code
- Revision number
- Serial number

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1018h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|---|
| Identity object | 1018h | | |
| Highest subindex supported | | 00h | |
| Vendor ID | | 01h | Vendor ID |
| Product code | | 02h | <ul style="list-style-type: none"> ▪ 80h: EAM580RS_MT Multiturn Encoder ▪ 81h: EAM580RS_ST Singleturn Encoder |
| Revision number | | 03h | Product revision No. |
| Serial number | | 04h | Serial No. |

5.1.12.5 Module identification

This function reads out the manufacturer-specific offset.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 650Ah

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|-------------|
| Module identification | 650Ah | | |
| Highest subindex supported | | 00h | |
| Manufacturer offset | | 01h | |

5.1.12.6 Profile & software version

This function reads out software version and profile as a hex value.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6507h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|---|
| Profile & software version | 6507h | – | Contains the implemented encoder device profile version and the manufacturer specific software version. |

5.1.12.7 Serial number

Function *serial number* reads out the sensor's serial.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 650Bh

| Name | Object | Subindex | Description |
|---------------|--------|----------|--------------------------------------|
| Serial number | 650Bh | – | Internally linked to object 1018h-4h |

5.1.12.8 Software version

This function reads out the sensor's firmware version.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 100Ah

| Name | Object | Subindex | Description |
|------------------|--------|----------|-------------------------------|
| Software version | 100Ah | – | Manufacturer software version |

5.1.13 Diagnostic functions

5.1.13.1 Operating Status

Function *Operating Status* reads out the current operating status of the sensor.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6500h

| Name | Object | Subindex | Description |
|------------------|--------|----------|---|
| Operating Status | 6500h | – | Bit 0: <ul style="list-style-type: none"> ▪ 0: Position CW ▪ 1: Position CCW Bit 2: <ul style="list-style-type: none"> ▪ 0: Scaling function disabled ▪ 1: Scaling function enabled |

5.1.13.2 Operation Time

Function *Operation Time* reads out the operating time of the sensor.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 2A00h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|---|
| Operation Time | 2A00h | – | – |
| Highest subindex supported | | 00h | – |
| Current | | 01h | Current operation time since boot up [s]. |
| Total | | 02h | Total operation time [s]. |

CANopen access: 6508h

| Name | Object | Subindex | Description |
|----------------|--------|----------|-----------------------------|
| Operating Time | 6508h | – | Operating time in 0.1 hours |

5.1.13.3 Operation Cycle Counter

Function *Operation Cycle Counter* reads out the number of operating cycles.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 2A01h

| Name | Object | Subindex | Description |
|-------------------------|--------|----------|--|
| Operation Cycle Counter | 2A01h | – | Number of operating cycles. Incremented at Power On. |

5.1.13.4 External Supply Voltage

Function *External power supply* reads out information on external power supply.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 2A20h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|--------------------------------------|
| External Supply Voltage | 2A20h | – | |
| Highest subindex supported | | 00h | |
| Current | | 01h | Current external supply voltage [mV] |
| Min | | 02h | Min. external supply voltage [mV] |
| Max | | 03h | Max. external supply voltage [mV] |

5.1.13.5 Battery Voltage

Function *battery voltage* reads out the sensor information on the battery voltage.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 2A80h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|------------------------------|
| Battery Voltage | 2A80h | | |
| Highest subindex supported | | 00h | |
| Current | | 01h | Current battery voltage [mV] |

5.1.13.6 Temperature

This function reads the sensor's temperature information.

For more detailed information on the following please refer to chapter [Annex ▸ 63](#).

CANopen access: 2A40h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|--------------------------|
| Temperature | 2A40h | | |
| Highest subindex supported | | 00h | |
| Current | | 01h | Current Temperature [°C] |
| Min | | 02h | Min. Temperature [°C] |
| Max | | 03h | Max. Temperature [°C] |

5.1.13.7 CW / CCW Information

This function reads out the number of swept revolutions swept per direction of rotation.

For more detailed information on the following please refer to chapter [Annex ▸ 63](#).

CANopen access: 2A81h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|---|
| CW / CCW Information | 2A81h | – | |
| Highest subindex supported | | 00h | |
| CW Counter | | 01h | Total number of revolutions clockwise |
| CCW Counter | | 02h | Total number of counter-clockwise revolutions |

5.2 CANopen safety

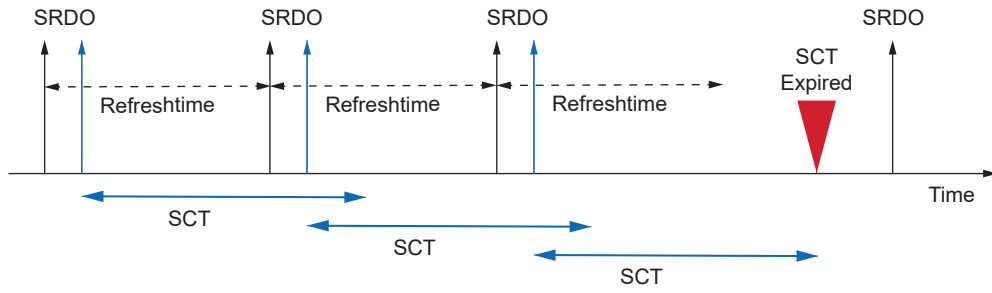

5.2.1 SRDO communication

Further to conventional CANopen services for data transmission (e.g. SDO and PDO), safety extended by service SRDO defines a special data transmission service (Safety Related Data Object).

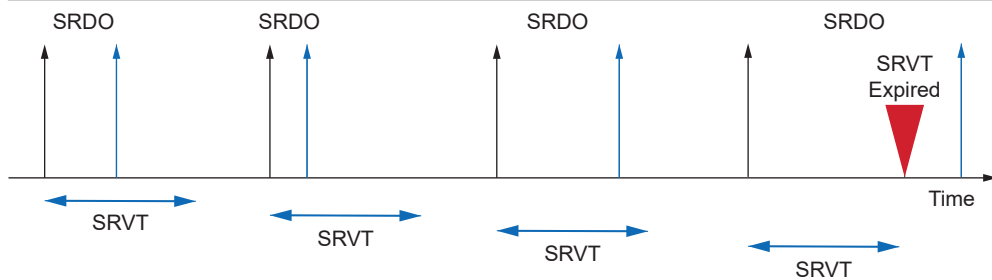

Configuration and type of communication is similar to PDO. However, SRDO communication provides the following additional features:

- cyclical data transmission with timeout monitoring
- double transmission of user data, once inverted bit by bit
- data consistency checks
- Checks of the time interval between inverted and non-inverted data
- CRC protected configuration

Diagram CANopen Safety Timing

| | |
|--------------------------------|---|
| SCT (Safety Cycle Time) | Time interval to be kept in cyclical SRDO transmission. Exceeding SCT will be recognized by the consumers and make them go to safe state. |
|--------------------------------|---|

| | |
|--|--|
| SRVT (Safety-related Validation Time) | Describes the time allowed to elapse between 2 CAN messages of a SRDO. |
|--|--|

COB IDs in the range from 100h to 180h are used to prevent transmissions within the CANopen network from interfering with other services and to ensure the priority of CAN IDs is higher than that of PDOs.

5.2.1.1 SRDO-CAN message structure

SRDO1

SRDO2

SRDO3

III. 5: SRDO CAN message structure

5.2.2 Safety functions

5.2.2.1 Configuration of safe communication parameters

- 1301h - 1303h ... SRDO communication parameters
- 1381h - 1383h ... SRDO mapping parameters
- 13FEh ... Indicator for valid configuration
- 13FFh ... CRC safety configuration

The CRC polynomial specified in the standard *EN50325-5* for calculating the security configuration signature (object 13FFh) must use the data in accordance with *EN50325-5*.

5.2.2.2 CRC generation

Baumer Safety CRC Tool calculates the CRC checksums (*Cyclic Redundancy Check*) for safe communication and application parameters.

The calculated checksums must be embedded in the corresponding objects (13FFh, 31FFh).

In the following are the CRCs for the factory settings:

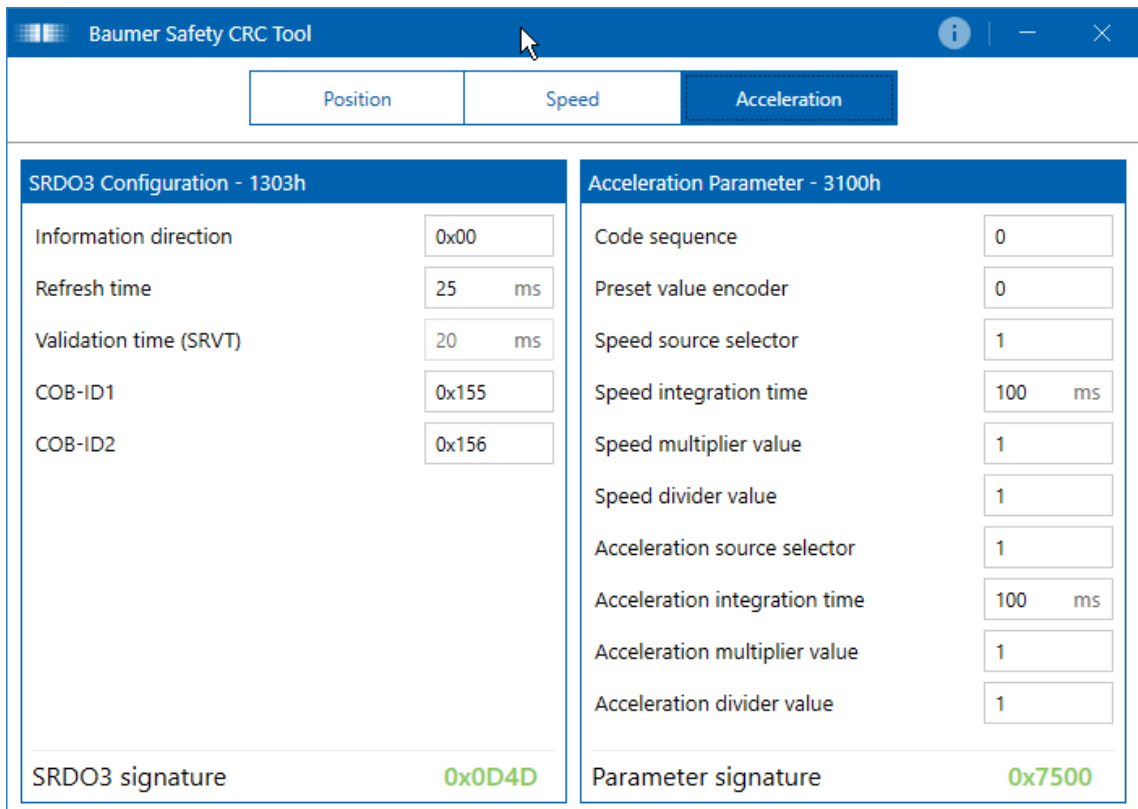

The screenshot shows the 'Baumer Safety CRC Tool' window with three tabs: 'Position', 'Speed', and 'Acceleration'. The 'Position' tab is active. It displays two configuration panels:

| SRDO1 Configuration - 1301h | | Position Parameter - 6100h | |
|-----------------------------|------------------------------------|----------------------------|--------------------------------|
| Information direction | <input type="text" value="0x01"/> | Code sequence | <input type="text" value="0"/> |
| Refresh time | <input type="text" value="25"/> ms | Preset value encoder | <input type="text" value="0"/> |
| Validation time (SRVT) | <input type="text" value="20"/> ms | | |
| COB-ID1 | <input type="text" value="0x101"/> | | |
| COB-ID2 | <input type="text" value="0x102"/> | | |
| SRDO1 signature | 0x250D | Parameter signature | 0xC537 |

///. 6: Factory settings - SRDO1

III. 7: Factory settings - SRDO2

III. 8: Factory settings - SRDO3

5.2.2.3 Configuration valid

Using this function it has to be confirmed that safety configuration has been completed and is valid (value A5h).

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 13FEh

| Name | Object | Subindex | Description |
|---------------------|--------|----------|--------------------------------------|
| Configuration valid | 13FEh | – | Must be actuated with the value A5h. |

5.2.2.4 Safety position configuration parameters

This function is for reading/writing the *Safety position configuration parameters*.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6100h

| Name | Object | Subindex | Description |
|--|--------|----------|----------------------------|
| Safety position configuration parameters | 6100h | – | – |
| Highest subindex supported | | 00h | – |
| Code Sequence | | 01h | Code Sequence |
| Preset | | 02h | Preset for safety position |

5.2.2.5 Safety speed configuration parameters

This function is for reading/writing the *Safety speed configuration parameters*.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6101h

| Name | Object | Subindex | Description |
|---------------------------------------|--------|----------|-------------|
| Safety speed configuration parameters | 6101h | – | – |
| Highest subindex supported | | 00h | – |
| Code Sequence | | 01h | – |
| Preset | | 02h | – |
| Safety speed source selector | | 04h | – |
| Safety speed integration time | | 05h | – |
| Safety speed multiplier value | | 06h | – |
| Safety speed divider value | | 07h | – |

5.2.2.6 Safety position value / Safety inverted position value

In both following objects, the safe positions *standard* and *inverted* is stored as an array. The safe position comprises 14 bits singleturn and 18 bits multiturn.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6120h

In this object, the safe position *standard* is saved as an array.

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|-------------|
| Safety position value | 6120h | – | |
| Highest subindex supported | | 00h | |
| Safety position 1st Byte | | 01h | |
| Safety position 2nd Byte | | 02h | |
| Safety position 3rd Byte | | 03h | |
| Safety position 4th Byte | | 04h | |

CANopen access: 6121h

In this object, the safe position *inverted* is saved as an array.

| Name | Object | Subindex | Description |
|--------------------------------|--------|----------|-------------|
| Safety inverted position value | 6121h | – | |
| Highest subindex supported | | 00h | |
| Safety position 1st Byte | | 01h | |
| Safety position 2nd Byte | | 02h | |
| Safety position 3rd Byte | | 03h | |
| Safety position 4th Byte | | 04h | |

5.2.2.7 Safety speed value / Safety speed inverted value

In the two following objects, safe speeds *normal* and *inverted* are saved as an array.

For more detailed information on the following please refer to chapter [Annex ▸ 63](#).

CANopen access: 6124h

In this object, safe speed *normal* is saved as an array.

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|-------------|
| Safety speed value | 6124h | – | |
| Highest subindex supported | | 00h | |
| Safety speed 1st Byte | | 01h | |
| Safety speed 2nd Byte | | 02h | |

CANopen access: 6125h

In this object, the safe speed *inverted* is saved as an array.

| Name | Object | Subindex | Description |
|-----------------------------|--------|----------|-------------|
| Safety speed inverted value | 6125h | – | |
| Highest subindex supported | | 00h | |
| Safety speed 1st Byte | | 01h | |
| Safety speed 2nd Byte | | 02h | |

5.2.2.8 Safety application configuration valid

This function is used for setting the *Safety application configuration valid*.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 61FEh

| Name | Object | Subindex | Description |
|--|--------|----------|---|
| Safety application configuration valid | 61FEh | – | is to be set valid (value A5h), after the Safety application configuration is completed |

5.2.2.9 Safety acceleration parameter

This function is for reading/writing the *Safety acceleration parameter*.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 3100h

| Name | Object | Subindex | Description |
|--------------------------------------|--------|----------|-------------|
| Safety acceleration parameter | 3100h | – | – |
| Highest subindex supported | | 0 | – |
| Code Sequence | | 01h | – |
| Preset | | 02h | – |
| Safety speed source selector | | 04h | – |
| Safety speed integration time | | 05h | – |
| Safety speed multiplier value | | 06h | – |
| Safety speed divider value | | 07h | – |
| Safety acceleration source selector | | 08h | – |
| Safety acceleration integration time | | 09h | – |
| Safety acceleration multiplier value | | 0Ah | – |
| Safety acceleration divider value | | 0Bh | – |

5.2.2.10 Safety acceleration configuration signature

This function is used to write the Safety acceleration signature (CRC).

CANopen access: 31FFh

| Name | Object | Subindex | Description |
|---|--------|----------|-------------------------------------|
| Safety acceleration configuration signature | 31FFh | – | CRC value covering objects 3100h-xx |

5.2.2.11 Safety configuration signature

This function is used to write the Safety configuration signature (CRC).

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 13FFh

| Name | Object | Subindex | Description |
|--------------------------------|--------|----------|-----------------------------|
| Safety configuration signature | 13FFh | – | |
| Highest subindex supported | | 00h | |
| SRDO1 signature (CRC) | | 01h | CRC covers objects 1301h-xx |
| SRDO2 signature (CRC) | | 02h | CRC covers objects 1302h-xx |
| SRDO3 signature (CRC) | | 03h | CRC covers objects 1303h-xx |

5.2.2.12 Safety acceleration value

In both following objects, the safe acceleration "normal" and "inverted" are saved as an array.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 3000h

| Name | Object | Subindex | Description |
|------------------------------|--------|----------|--|
| Safety acceleration value | 3000h | – | In this object the safe acceleration is stored "normal" as an array. |
| Highest subindex supported | | 00h | |
| Safety acceleration 1st byte | | 01h | |
| Safety acceleration 2nd byte | | 02h | |

CANopen access: 3001h

| Name | Object | Subindex | Description |
|------------------------------------|--------|----------|--|
| Safety acceleration inverted value | 3001h | – | In this object the safe acceleration is stored "inverted" as an array. |
| Highest subindex supported | | 00h | |
| Safety acceleration 1st byte | | 01h | |
| Safety acceleration 2nd byte | | 02h | |

5.2.2.13 SRDOx

5.2.2.13.1 SRDO1 Communication parameters

This function is for read/write the SRDO1 communication parameters.

CANopen access: 1301h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|---|
| SRDO1 communication param. | 1301h | – | – |
| Highest subindex supported | | 00h | – |
| Information direction | | 01h | <ul style="list-style-type: none"> ■ 00h: not valid ■ 01h: valid, Tx, SRDO producer |
| Refresh-time SCT | | 02h | Safety Cycle Time |
| Validation Time SRVT | | 03h | Safety-related Validation Time |
| Transmission type | | 04h | – |
| COB-ID 1 | | 05h | COB-ID for not inverted SRDO frame |
| COB-ID 2 | | 06h | COB-ID for inverted SRDO frame |

5.2.2.13.2 SRDO1 mapping parameters

This function reads the SRDO1 mapping parameters.

For more detailed information on the following please refer to chapter [Annex ▶ 63](#).

CANopen access: 1381h

| Name | Object | Subindex | Description |
|--------------------------------|--------|----------|---|
| SRDO1 mapping parameter | 1381h | – | – |
| Highest subindex supported | | 00h | – |
| SR app. data object 1 | | 01h | Safety position 1st byte (LSB) |
| SR app. data object 1 inverted | | 02h | Safety position inverted 1st byte (LSB) |
| SR app. data object 2 | | 03h | Safety position 2nd byte |
| SR app. data object 2 inverted | | 04h | Safety position inverted 2nd byte |
| SR app. data object 3 | | 05h | Safety position 3rd byte |
| SR app. data object 3 inverted | | 06h | Safety position inverted 3rd byte |
| SR app. data object 4 | | 07h | Safety position 4th byte (MSB) |
| SR app. data object 4 inverted | | 08h | Safety position inverted 4th byte (MSB) |

5.2.2.13.3 SRDO2 Communication parameters

This function is for read/write the SRDO2 communication parameters.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1302h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|---|
| SRDO2 communication param. | 1302h | – | – |
| Highest subindex supported | | 00h | – |
| Information direction | | 01h | <ul style="list-style-type: none"> ▪ 00h: not valid ▪ 01h: valid, Tx, SRDO producer |
| Refresh-time SCT | | 02h | Safety Cycle Time |
| Validation Time SRVT | | 03h | Safety-related Validation Time |
| Transmission type | | 04h | – |
| COB-ID 1 | | 05h | COB-ID for not inverted SRDO frame |
| COB-ID 2 | | 06h | COB-ID for inverted SRDO frame |

5.2.2.13.4 SRDO2 mapping parameters

This function reads the SRDO2 mapping parameters.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1382h

| Name | Object | Subindex | Description |
|--------------------------------|--------|----------|--------------------------------------|
| SRDO2 mapping parameter | 1382h | – | – |
| Highest subindex supported | | 00h | – |
| SR app. data object 1 | | 01h | Safety speed 1st byte (LSB) |
| SR app. data object 1 inverted | | 02h | Safety speed inverted 1st byte (LSB) |
| SR app. data object 2 | | 03h | Safety speed 2nd byte (MSB) |
| SR app. data object 2 inverted | | 04h | Safety speed inverted 2nd byte (MSB) |

5.2.2.13.5 SRDO3 Communication parameters

This function is for read/write the SRDO3 communication parameters.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1303h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|---|
| SRDO3 communication param. | 1303h | – | – |
| Highest subindex supported | | 00h | – |
| Information direction | | 01h | <ul style="list-style-type: none"> ▪ 00h: not valid ▪ 01h: valid, Tx, SRDO producer |
| Refresh-time SCT | | 02h | Safety Cycle Time |
| Validation Time SRVT | | 03h | Safety-related Validation Time |
| Transmission type | | 04h | – |
| COB-ID 1 | | 05h | COB-ID for not inverted SRDO frame |
| COB-ID 2 | | 06h | COB-ID for inverted SRDO frame |

5.2.2.13.6 SRDO3 mapping parameters

This function reads the SRDO3 mapping parameters.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

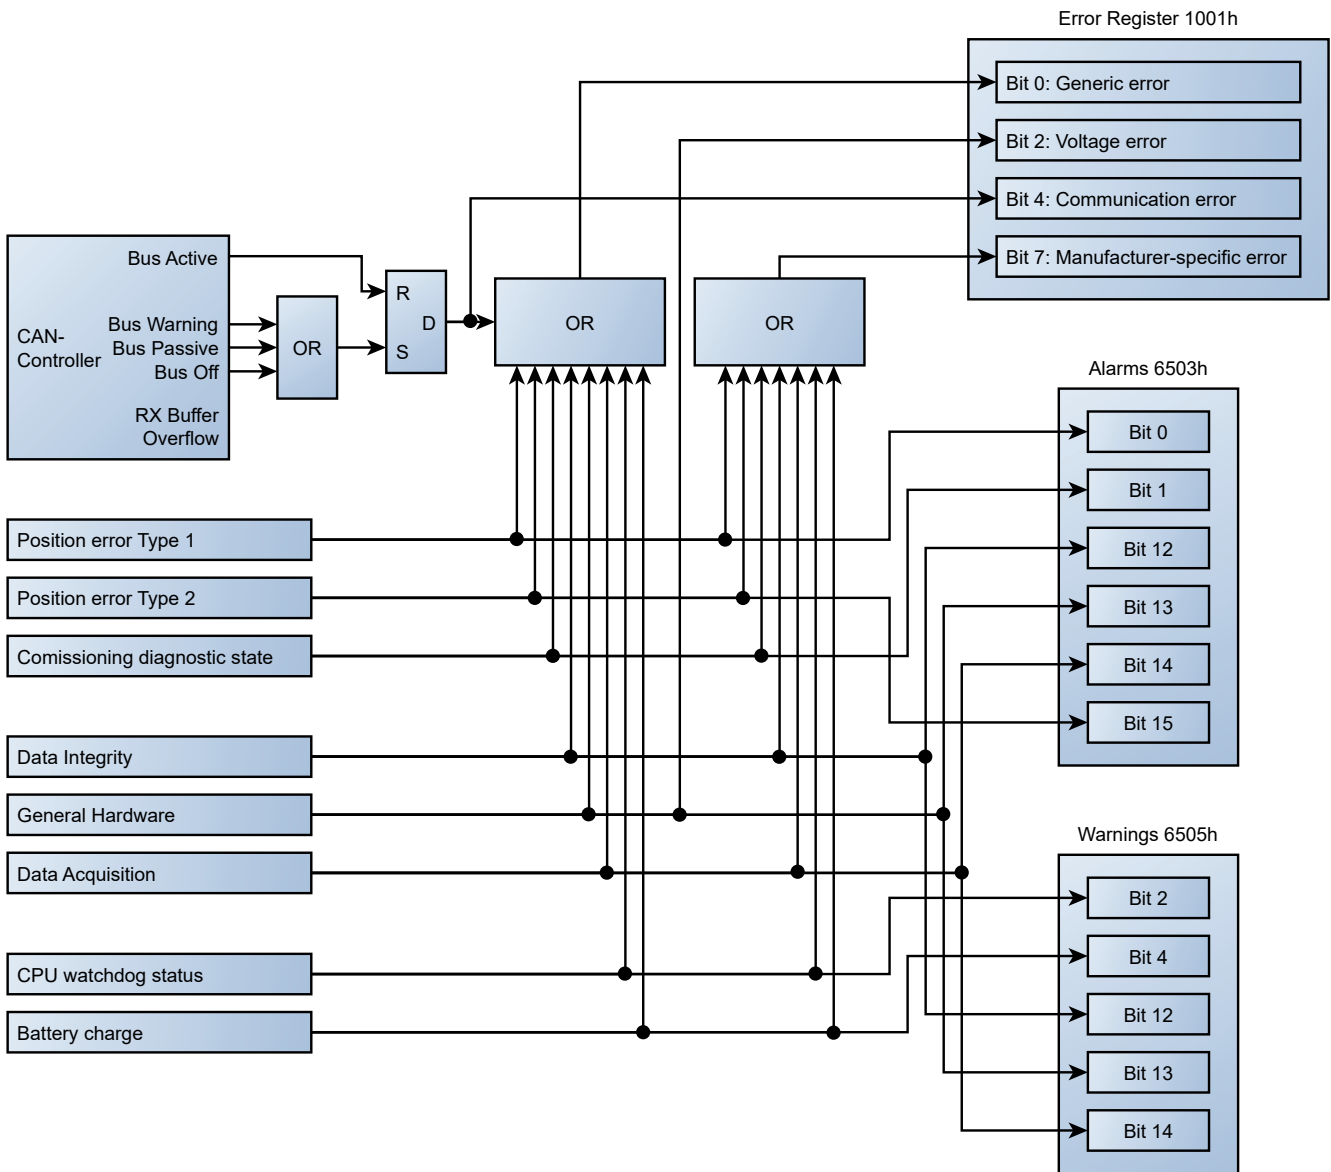

CANopen access: 1383h

| Name | Object | Subindex | Description |
|--------------------------------|--------|----------|---|
| SRDO3 mapping parameter | 1383h | – | – |
| Highest subindex supported | | 00h | – |
| SR app. data object 1 | | 01h | Safety acceleration 1st byte (LSB) |
| SR app. data object 1 inverted | | 02h | Safety acceleration inverted 1st byte (LSB) |
| SR app. data object 2 | | 03h | Safety acceleration 2nd byte (MSB) |
| SR app. data object 2 inverted | | 04h | Safety acceleration inverted 2nd byte (MSB) |

5.3 Emergency Service

In the event of error, the device transmits an emergency message while setting the corresponding bits in the error register (object 1001h).

Errr code access is via object 1003h-x. The error register saves a history of max. 8 error codes.

III. 9: Error register diagram

5.3.1 COB-ID

The COB ID for the Emergency Message can be changed (via object 1014h).

Default value: 80h + Node-ID

Changes are immediately adopted.

NOTICE

Manual editing and saving the COB ID will not change the COB-ID in susequent changes of the Node-ID.

5.3.2 Emergency COB-ID

This function can be used to read/write the sensor's *Emergency COB-ID*.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1014h

| Name | Object | Subindex | Description |
|------------------|--------|----------|--------------------------------|
| Emergency COB-ID | 1014h | – | COB-ID of the emergency object |

5.3.3 Error Register

Function *Error register* reads out the sensor's error register.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1001h

| Name | Object | Subindex | Description |
|----------------|--------|----------|--|
| Error Register | 1001h | – | <ul style="list-style-type: none"> ▪ Bit0: Generic error ▪ Bit2: Voltage error ▪ Bit4: Communication error ▪ Bit7: Manufacturer-specific error |

5.3.4 Error behaviour

Function *error behavior* defines the sensor behavior of in the event of error.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 1029h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|--|
| Error behaviour | 1029h | – | |
| Highest subindex supported | | 00h | |
| Communication error | | 01h | <ul style="list-style-type: none"> 0h: Change to pre-operational mode |
| Generic error | | 02h | <ul style="list-style-type: none"> 1h: No state change |
| Voltage error | | 03h | <ul style="list-style-type: none"> 2h: Change to stopped mode |

5.3.5 Error Injection

Function *error simulation* will simulate errors for sensor testing.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 2116h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|---|
| Error Injection | 2116h | – | Simulation of encoder errors for test purposes |
| Highest subindex supported | | 00h | |
| Warning | | 01h | <ul style="list-style-type: none"> 1: Emergency Warning is simulated |
| Alarm | | 02h | <ul style="list-style-type: none"> 1: Emergency Alarm is simulated |

5.3.6 Alarms

Function *Alarms* outputs the alarms currently present at the sensor.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6503h

| Name | Object | Subindex | Description |
|--------|--------|----------|--|
| Alarms | 6503h | – | Object 6503h provides alarm information according the following table. |

The following alarms are supported:

| Bit | Description | Value=0 | Value=1 |
|----------|--------------------------------|--------------|----------|
| 0 | Position error type 1 | Not occurred | Occurred |
| 1 | Commissioning diagnostic state | OK | Error |
| 2 ... 11 | Reserved | – | – |
| 12 | Data Integrity | OK | Not OK |
| 13 | General Hardware | OK | Not OK |
| 14 | Data Acquisition | OK | Not OK |
| 15 | Position error type 2 | Not occurred | Occurred |

5.3.7 Supported alarms

This function outputs the currently sensor-supported alarms.

For more detailed information on the following please refer to chapter [Annex | 63](#).

CANopen access: 6504h

| Name | Object | Subindex | Description |
|------------------|--------|----------|--|
| Supported alarms | 6504h | – | Contains the information on supported alarms by the encoder. |

5.3.8 Warnings

Function *Warnings* function outputs the warnings currently present at the sensor.

For more detailed information on the following please refer to chapter [Annex | 63](#).

CANopen access: 6505h

| Name | Object | Subindex | Description |
|----------|--------|----------|---|
| Warnings | 6505h | – | Object 6505h provides warning information according the following table |

| Bit | Description | Value=0 | Value=1 |
|----------|---------------------|---------|-----------------|
| 0 | Reserved | – | – |
| 1 | Reserved | – | – |
| 2 | CPU watchdog status | OK | Reset generated |
| 3 | Reserved | – | – |
| 4 | Battery charge | OK | Too low |
| 5 | Reserved | – | – |
| 6 | Reserved | – | – |
| 7 | Reserved | – | – |
| 8 | Reserved | – | – |
| 9 ... 11 | Reserved | – | – |
| 12 | Data Integrity | OK | Not OK |
| 13 | General Hardware | OK | Not OK |

| Bit | Description | Value=0 | Value=1 |
|-----|------------------|---------|---------|
| 14 | Data Acquisition | OK | Not OK |
| 15 | Reserved | – | – |

5.3.9 Supported warnings

This function outputs the warnings currently supported by the sensor.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6506h

| Name | Object | Subindex | Description |
|--------------------|--------|----------|--|
| Supported warnings | 6506h | – | Contains the information on supported warnings by the encoder. |

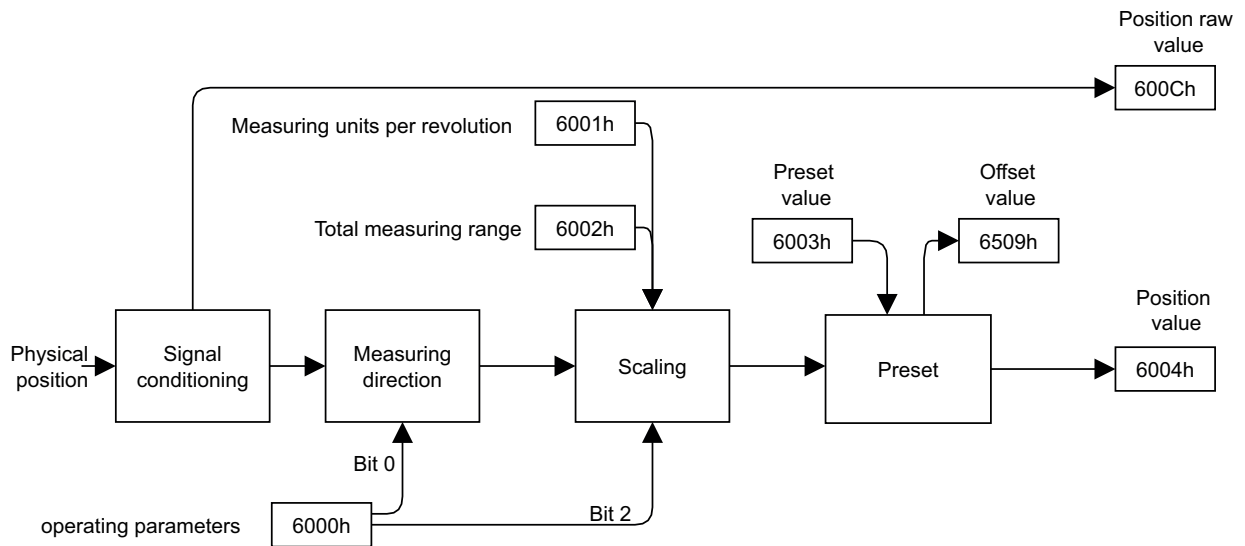

6 Operating functions

6.1 Position encoder value

This function reads out the encoder position.

The position is transmitted as part of the cyclic communication (process data). In addition, the position information is available via acyclic communication.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

The position range depends on the settings in objects 6001h and 6002h.

CANopen access: 6004h

| Name | Object | Subindex | Description |
|------------------------|--------|----------|---------------------------------|
| Position encoder value | 6004h | – | Position in steps, scaled value |

CANopen access: 600Ch

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|------------------------------|
| Position encoder raw value | 600Ch | – | Position in steps, raw value |

6.2 Speed Value

Function *Speed* provides 16-bit speed information together with the speed unit [steps/sec].

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6030h

| Name | Object | Subindex | Description |
|-----------------------------|--------|----------|-----------------------------|
| Speed Value | 6030h | | |
| Highest sub-index supported | | 00h | |
| Speed Value | | 01h | Speed value in steps/second |

INFO

During *Speed integration time* (6031h-02), the value determined with *Speed Value* (6030h) is not valid.

6.3 Speed parameter

Function *speed parameter* is for editing various parameters for speed determination.

CANopen access: 6031h

| Name | Object | Subindex | Description |
|-----------------------------|--------|----------|--|
| Speed parameter | 6031h | | |
| Highest sub-index supported | | 00h | |
| Speed source selector | | 01h | <ul style="list-style-type: none"> ■ 1: 6004h Position value ■ 2: 600Ch Position raw value |
| Speed integration time | | 02h | in ms |
| Multiplier value | | 03h | Output value multiplier |
| Divider value | | 04h | Output value divider |

6.4 Acceleration Value

This function provides 16-bit acceleration information in unit [steps/sec²].

As the acceleration value is highly dynamic, the user should adapt scaling and filter to his application. As the output value is a 16-bit value, the user must pay attention to the limit values.

Unit of acceleration value

The acceleration value derives from the position value. In the following is a calculation example where acceleration is calculated by position. In the example, there is a change in speed to 6000rpm within one second.

6000 = rpm/s (revolutions per second)

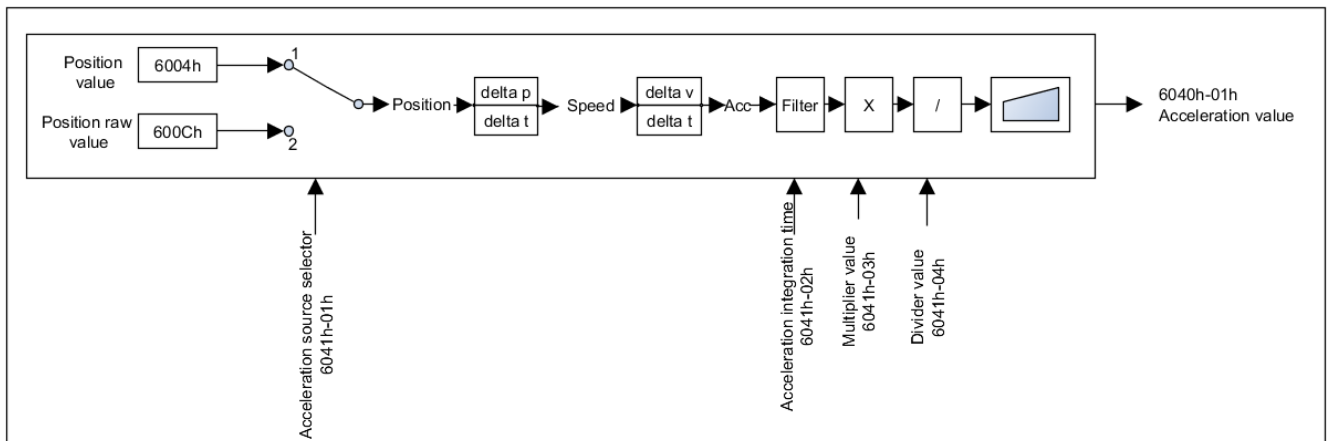

100 = r/s² (revolutions per second²)

100*2¹⁴= steps/s² (steps per second²)

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6040h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|--|
| Acceleration Value | 6040h | | |
| Highest subindex supported | | 00h | |
| Acceleration value | | 01h | Acceleration value [steps/s ²] |

INFO

During *Acceleration integration time* (6041h-02), the value determined with *Acceleration Value* (6040h) is not valid.

6.5 Acceleration parameter

This function is for editing the parameters for determining acceleration.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6041h

| Name | Object | Subindex | Description |
|-------------------------------|--------|----------|--|
| Acceleration parameter | 6041h | | |
| Highest sub-index supported | | 00h | |
| Acceleration source selector | | 01h | <ul style="list-style-type: none"> ■ 1: 6004h Position value ■ 2: 600Ch Position raw value |
| Acceleration integration time | | 02h | |
| Multiplier value | | 03h | Output value multiplier |
| Divider value | | 04h | Output value divider |

6.6 Gear Factor

This function is used to configure the electronic gear function.

NOTICE

This function is also known as *Zähler/Nenner-Skalierung* or *Rundachsenfunktion*.

Enabled gear factor () means the encoder mounted to the primary side (gearbox input) will output position data as if mounted to the secondary side (gearbox output).

Parameter *total measuring range* always defines the number of steps required for one revolution at the gearbox output (secondary side).

Primary side (drive side)
Denominator

Secondary side (driven side)
Nominator

$$\text{Gear factor } i = \frac{\text{Numerator}}{\text{Denominator}} = \frac{\text{Speed at drive side (n2)}}{\text{Speed at driven side (n1)}} = \frac{\text{Number of teeth at driven side (z1)}}{\text{Number of teeth at drive side (z2)}}$$

The values for gear factor numerator and denominator result directly from the number of teeth. In the above example, the number of teeth at the secondary side is 75 and 10 on the primary side.

Parameter *Measuring units per revolution* is not set in the gear factor function, but results from the total measuring range, numerator and denominator.

$$\text{Measuring units per revolution} = \text{total measuring range} * \frac{\text{denominator}}{\text{numerator}}$$

Example

Transmission factor to be 75:10 (i.e. 7.5). Required resolution on the secondary side of the gearbox to be "1 revolution = 10000 steps".

Numerator 75, denominator 10. Both numerator and denominator must be integer values. Total measuring range is 10000.

Encoder completes 7.5 revolutions within one revolution on the gearbox secondary side. The encoder value resulting from *Measuring units per revolution* is $10000 / 7.5 = 1333.3333$.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen Access: 2001h

| Name | Object | Subindex | Description |
|----------------------------|--------|----------|---|
| Gear Factor Configuration | 2001h | – | Configuration of electronic gear function |
| Highest subindex supported | | 00h | |
| Mode Control | | 01h | <ul style="list-style-type: none"> ■ 0: electronic gear function disabled ■ 1: electronic gear function enabled |
| Numerator | | 02h | Numerator of the gear factor |
| Denominator | | 03h | Denominator of the gear factor |

The formula below equals valid combinations of numerator, denominator and total measuring range.

$$\text{Measuring units per revolution} = \text{total measuring range} * \frac{\text{denominator}}{\text{numerator}} = 2^{32} * 1/16384 = 262144$$

$$\text{Measuring units per revolution} = 2^{32} * 1/16384 = 262144$$

Parameter *Measuring units per revolution* must not exceed the maximum permitted encoder limits.

NOTICE

Parameter *Measuring units per revolution* is calculated by the encoder itself and does not need to be configured.

In this mode, please only configure the following parameters:

- Total measuring range 6002h
- Gear factor counter 2001h-02h
- Denominator of the transmission factor 2001h-03h

Gear factor: numerator 2001h-02h

This parameter is only considered with enabled gear factor functionality.

When using gear reduction ($n_2 < n_1$), the gear factor numerator is bigger than the denominator.

NOTICE

Term *numerator* is used as a synonym for *counter*.

Gear factor: denominator 2001h-03h

This parameter is only considered with enabled gear factor functionality.

When using transmission ($n_2 > n_1$), the denominator is bigger than the numerator.

NOTICE

Term *denominator* is used as a synonym for *denominator*.

The formula below equals valid combinations of numerator, denominator and total measuring range.

$$\text{Measuring units per revolution} = \text{total measuring range} * \frac{\text{denominator}}{\text{numerator}} = 2^{32} * 1/16384 = 262144$$

Parameter *Measuring units per revolution* must not exceed the maximum permitted encoder limits.

Gear factor - Counter

This parameter is only considered with enabled gear factor functionality.

When using gear reduction ($n_2 < n_1$), the gear factor numerator is bigger than the denominator.

Gear factor - denominator

This parameter is only considered with enabled gear factor functionality.

When using transmission ($n_2 > n_1$), the denominator is bigger than the numerator.

6.7 Number of distinguishable revolutions

This function outputs the maximum number of revolutions.

For more detailed information on the following please refer to chapter [Annex | 63](#).

CANopen access: 6502h

| Name | Object | Subindex | Description |
|---------------------------------------|--------|----------|----------------------------|
| Number of distinguishable revolutions | 6502h | – | max. multiturn revolutions |

6.8 Used single turn resolution

This function outputs the current resolution for one revolution [steps/revolution].

For more detailed information on the following please refer to chapter [Annex | 63](#).

CANopen access: 6501h

| Name | Object | Subindex | Description |
|--|--------|----------|-------------------------------------|
| Used single turn resolution [step/rev] | 6501h | – | max. Measuring units per revolution |

6.9 Operating parameter

This function is used for editing the sensor's operating parameters.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6000h

| Name | Object | Subindex | Description |
|---------------------|--------|----------|---|
| Operating parameter | 6000h | – | Bit 0: <ul style="list-style-type: none"> ■ 0: Position CW ■ 1: Position CCW Bit 2: <ul style="list-style-type: none"> ■ 0: Scaling function disabled ■ 1: Scaling function enabled |

6.10 is

This function will have an influence on the measuring range [Measuring range in steps].

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6002h

| Name | Object | Subindex | Description |
|-----------------------|--------|----------|---|
| Total measuring range | 6002h | – | Total measuring range in Steps. Exception: Value 0h means 1'0000'0000h Steps |

6.11 Measuring units per revolution

This function sets the required resolution for a single revolution [steps/revolution].

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6001h

| Name | Object | Subindex | Description |
|---|--------|----------|---------------------------------|
| Measuring units per revolution [Step/rev] | 6001h | – | Measuring units per revolution. |

Limitations

According to the settings in Measuring units per revolution (6001h) and Total measuring range (6002h) as well as the maximum permitted number of encoder revolutions ($2^{30} = 1'073'741'824$) the encoder operates automatically in endless mode.

Endless mode is a prerequisite for operation:

$$2^{30} \frac{\text{measuring units per revolution (6001h)}}{\text{total measuring range (6002h)}} \neq 2^x$$

$$x \in \mathbb{N} (1, 2, 3, \dots)$$

In endless operation, the maximum encoder revolution must be less than²²⁹ (536,870,912) revolutions while the encoder not live or the duty cycle is less than 5 minutes. Exceeding this number of revolutions requires encoder referencing at every power on (see Preset value, 6003h).

Example 1: Parameter settings for encoder operation without restrictions

Maximum possible revolutions: 1'073'741'824 (30 bit multiturn)

Measuring units per revolution: 3600

Total measuring range: 29'491'200

Calculation: $1'073'741'824 \times 3600 / 29'491'200 = 131'072 = (2^{17})$

Example 2: Parameter settings for automatic encoder operation in endless mode

Maximum possible revolutions: 1'073'741'824 (30 bit multiturn)

Measuring units per revolution: 3600

Total measuring range: 100'000

Calculation: $1'073'741'824 \times 3600 / 100'000 = 38'654'705.664 \neq (2^x)$

6.12 Offset encoder

This function reads out the sensor offset.

CANopen access: 6509h

| Name | Object | Subindex | Description |
|----------------|--------|----------|---|
| Offset encoder | 6509h | – | Internal offset calculated during the preset process. |

6.13 Preset value encoder

This function has an influence on the preset value.

For more detailed information on the following please refer to chapter [Annex \[▶ 63\]](#).

CANopen access: 6003h

| Name | Object | Subindex | Description |
|----------------------|--------|----------|-----------------------|
| Preset value encoder | 6003h | – | Preset value in steps |

7 Annex

7.1 CANopen object dictionary

The tables below show a summary of all SDO objects supported by the encoder.

| | |
